

## Exercise 04 - removeFromArray

Implement a function that takes an array and some other arguments then removes the other arguments from that array:

```
removeFromArray([1, 2, 3, 4], 3); // should remove 3 and return [1,2,4]
```

### Hints

The first test on this one is fairly easy, but there are a few things to think about(or google) here for the later tests:

- how to remove a single element from an array
- how to deal with multiple optional arguments in a javascript function
- Check this link. Scroll down to the bit about `Array.from` or the spread operator. - Or this link.
