

Exercise 07 - tempConversion

Write two functions that convert temperatures from Fahrenheit to Celsius, and vice versa:

```
convertToCelsius(32) // fahrenheit to celsius, should return 0
```

```
convertToFahrenheit(0) // celsius to fahrenheit, should return 32
```

Because we are human, we want the result temperature to be rounded to one decimal place: i.e., `convertToCelsius(100)` should return 37.8 and not 37.77777777777778.

This exercise asks you to create more than one function so the `module.exports` section of the spec file looks a little different this time. Nothing to worry about, we're just packaging both functions into a single object to be exported.

Hints

- You can find the relevant formulae on Wikipedia.
- Try to find by yourself on the Internet how to round a number to 1 decimal place in JavaScript. If you struggle, have a look [here](#).
